KOSTAL Energy Meter

- 24-hour home consumption measurement
- Operation of a connected battery storage unit
- Visualisation in the KOSTAL Solar Portal and Solar App
- Preconfigured as standard – simply connect
- LCD display shows the most important information
- Compatible in use with a PLENTICORE

KOSTAL has been recognised for its impressive performance in HTW Berlin's System Performance Index (SPI) since 2018. KOSTAL inverters prove that they deliver the best storage results in all classes, whether AC- or DC-coupled, single-phase or three-phase.

Thanks to the auto-update function, existing KOSTAL customers benefit retroactively and automatically from improved efficiency.

Tip: With the "virtual battery", solar plant operators who do not yet have a storage system can receive an individual forecast of possible self-consumption with a battery. Required: KOSTAL Solar App and KOSTAL (Smart) Energy Meter

Note: Please always follow the "Approved batteries" document on our website. Required: KOSTAL Solar App and KOSTAL (Smart) Energy Meter

PLENTICOIN

The PLENTICOIN is a single-purpose voucher for product upgrades and can be purchased in stores for a battery option.

Battery function

Thanks to the digital product upgrade option, the inverters can be easily upgraded to hybrid inverters using an activation code – either during installation or at a later date.

Battery sleep mode

The PLENTICORE has a special battery sleep mode that puts the connected storage system into a special sleep mode during periods of low solar irradiation. Deep discharge protection ensures that the battery is automatically recharged with an emergency charge using line current or connected AC sources.

AutoUpdate function

The PLENTICORE has an automatic software update function. Once activated and set up, the inverter installs each new software update fully automatically. This means that any functional enhancements, error rectification, compatibility with the latest battery storage systems and performance optimisation are always up to date.
